|------------|---------------|
| PT R27 002 | (DN 40 CF-R)  |

The part number (No) can be taken from the product nameplate

If not indicated otherwise in the legends, the illustrations in this document correspond to the gauges with the vacuum connection DN 25 ISO-KF. They apply to gauges with other vacuum connections by analogy

We reserve the right to make technical changes without prior notice

All dimensions in mm.

#### **Intended Use**

The PBR 260 Compact FullRange™ BA Gauge has been designed for vacuum measurement of non-flammable gases and gas mixtures in a pressure range 5×10<sup>-10</sup> ... 1000 mbar. The gauge is a part of the Pfeiffer Vacuum Compact Gauges family and can be operated in connection with the MaxiGauge™ vacuum measurement and control unit or with another evaluation unit.

### **Functional Principle**

Over the whole measurement range, the PBR 260 Compact FullRange™ BA Gauge has a continuous characteristic curve and its measuring signal is output as logarithm of the pressure

The gauge functions with a Bayard Alpert hot cathode ioniza-In a defined overlapping pressure range, a mixed signal of the two measurement systems is output. Above that range, a Pirani signal, below that range, a hot cathode signal is output. The Pirani measurement system switches the hot cathode measurement system on and off to prevent filament burn-out and excessive contamination. Two switching on/off ranges are available.

### Personnel Qualifications

### **General Safety Instructions**

- Adhere to the applicable regulations and take the necessary precautions for the process media used. Consider possible reactions between the materials  $(\rightarrow \mathbb{B}$  "Technical Data") and the process media. Consider possible reactions (e.g. explosion) of the process media due to the heat generated by the product.
- Adhere to the applicable regulations and take the necessary precautions for all work you are going to do and consider the safety instructions in this document.
- Before beginning to work, find out whether any vacuum components are contaminated. Adhere to the relevant regulations and take the necessary precautions when handling contaminated parts

Communicate the safety instructions to all other users.

#### Liability and Warranty

Pfeiffer Vacuum assumes no liability and the warranty becomes null and void if the end-user or third parties

- · disregard the information in this document .
- use the product in a non-conforming manner make any kind of interventions (modifications, alterations etc.) on the product
- use the product with accessories not listed in the corresponding product documentation.

The end-user assumes the responsibility in conjunction with the process media used.

Gauge failures due to contamination, as well as expendable parts (filament), are not covered by the warranty.

The gauge should be mounted so that no vibrations occur. The gauge may be mounted in any orientation. However, any particles and condensates present should not be able to penetrate into the measuring chamber. Install the gauge in such a way that it need not be removed for adjustment.

Remove the protective lid and install the product to the vacuum system.

### **Power Connection**

Precondition: Vacuum connection is properly made

P

- Before connecting or disconnecting the product, turn off the control system.
- If no sensor cable is available, make one according to the diagram.

Connect the signal cable to the gauge and secure it with the screw.

Connect the gauge to the measurement and control unit.

# Operation

When the voltage is applied, the measuring signal is available between pins 2 and 3. Over the whole measurement range, the measuring signal is output as a logarithm of the pressure (Relationship between measuring signal and pressure  $\rightarrow$  "Technical Data").

Allow for a stabilizing time of approx. 10 minutes. Once the gauge has been switched on, permanently leave it on irrespective of the pressure.

#### **Gas Type Dependence**

The measurement value is gas dependent. The display applies to dry air,  $N_2$ ,  $O_2$  and CO. For other gases, it has to be converted ( $\rightarrow$  "Technical Data").

If the gauge is operated in connection with a MaxiGauge<sup>TM</sup> vacuum measurement and control unit, a calibration factor can be entered for correction of the reading ( $\rightarrow \square$  [2]).

#### **Measurement Range**

The PBR 260 covers the measurement range of  $5 \times 10^{-10}$  mbar ... 1000 mbar.

- The Pirani system continuously monitors the pressure.
- The hot cathode system (controlled by the Pirani) is only switched on when the pressure drops below the set threshold (pon). The hot cathode will be ready for operation after a few seconds' heating time, when the <EMI ON> lamp is lit.
- When the pressure rises above the setpoint (p<sub>off</sub>) the hot cathode is switched off and the <EMI ON> lamp turns off.

In the upper pressure range, the Pirani reading and in the lower pressure range, the hot cathode reading is output. In the overlapping range ( $p_{\text{lower}} \dots p_{\text{upper}}$ ), a combined signal of the two measurement systems is supplied:

#### Defining the Switching on/off Range

The PBR 260 has two definable switching on/off ranges with their corresponding overlapping ranges. The switching on/off range is selected with the <P  $\leftrightarrow$  BA> switch and should be chosen in such a way that it is situated outside the process pressure range. The positions "high" (default) and "low" are available. Preferably, "low" should be selected as contamination of the hot cathode system is reduced at lower pressures.

The switching on/off range must be selected before the gauge is activated as the switch position is polled only when the gauge is switched on.

#### Adjusting the Gauge

The gauge is factory calibrated. If used under different climatic conditions or in a different position, through aging or contamination, and after exchanging the sensor, the characteristic curve can be offset and readjustment can become necessary. Only the Pirani element can be adjusted. The hot cathode system is factory adjusted.

#### HV adjustment:

At  $p\approx 2\textbf{x}10^{\cdot3}$  mbar the Pirani system is automatically adjusted by the hot cathode.

Adjustment at atmospheric pressure:

2 Insert a pin through the opening marked <ATM> and push the button inside for at least 5 s.

#### Zero point adjustment:

- A zero point adjustment is recommended
- after the sensor has been exchanged
- as part of the usual maintenance work for quality assurance.
- The push button used for the adjustment at atmospheric pressure is also used for the zero point adjustment.

- Operate gauge for approx. 10 minutes at a pressure of  $\leq 1 \times 10^{-4}$  mbar.
- Insert the pin through the opening marked <ATM> and push the button inside for at least 2 s..

The adjustment is done automatically and ends after 2 minutes.

#### Degas

Deposits on the electrode system of the hot cathode ionization gauge can lead to unstable measurement readings. In such a case it is advisable to start a degas process of the anode (bakeout) at a pressure below 7.2×10<sup>-6</sup> mbar (5 mA emission current). Depending on the application, this function can be activated via a MaxiGauge<sup>TM</sup> vacuum measurement and control unit, manually with a switch, or automatically by the system control (e.g. PLC). The bakeout process is automatically stopped by the PBR 260 after 3 minutes, if it has not been terminated before.

The degas process is activated when the control signal (Pin 1) switches from OFF (0 V) to ON (24 V). It is deactivated when the control signal switches from ON (24 V) to OFF (0 V), or after a maximum of 3 minutes.

For a repeated degas process, the control signal first has to switch from ON (24 V) to OFF (0 V), to then start the degas process again with ON (24 V). If the degas function is activated by the system control, it should be set to OFF again by the system control after max. 3 minutes of bakeout in order for an unambiguous operating status to be achieved.

The degas process causes a heating of the electron collector grid to approx. 700  $^\circ C$  by electron bombardment.

# Deinstallation

# Maintenace, Troubleshooting

, → □□ [1]

R Gauge failures due to contamination, as well as expendable parts (filament), are not covered by the warrantv.

# **Returning the Product**

#### WARNING

Caution: forwarding contaminated products Products returned to Pfeiffer Vacuum for service or repair should preferably be free of harmful substances (e.g. radioactive, toxic, caustic or microbiological)

Adhere to the forwarding regulations of all involved countries and forwarding companies and enclose a completed declaration of contamination.

Products that are not clearly declared as "free of harmful substances" are decontaminated at the expense of the customer.

When returning a product for service, put it in a tight and impact resistant package.

# Disposal

# DANGER Caution: contaminated parts

**ISTOP** 

Contaminated parts can be detrimental to health. Before beginning to work, find out whether any parts are contaminated. Adhere to the relevant regulations and take the necessary precautions when handling contaminated parts.

#### WARNING /!\

relevant local regulations.

Caution: substances detrimental to the environment Electronic components must be disposed of in accordance with special regulations Dispose of such products in accordance with the

Separating the components

After disassembling the product, separate its components according to the following criteria:

Contaminated components

Contaminated components (radioactive, toxic, caustic, or biological hazard etc.) must be decontaminated in accordance with the relevant national regulations separated according to their materials, and recycled.

Other components

Such components must be separated according to their materials and recycled.
